ECOAIR

HOME VENTILATION SYSTEM

Get even more peace of mind by installing an ECOAIR system, using Noel Watson's 15 years of expertise installing systems that are proven to deliver results.

The solution - an ECOAIR heat recovery ventilation system that quietly and efficiently pumps warm, dry air into the living spaces of your home, displacing the damp air created by everyday living.

First, we will come and visit your home to give you an obligation free quote. We will discuss your requirements with you regarding problems you might be having with condensation in your home.

ECOAIR will also offer FREE help and advice on heating and insulation issues that could save you a lot of money and give major improvements in health and well-being for you and your family.

Once you have signed up for your ECOAIR heat recovery system, we will discuss a suitable time to come and do the installation, usually within two weeks.

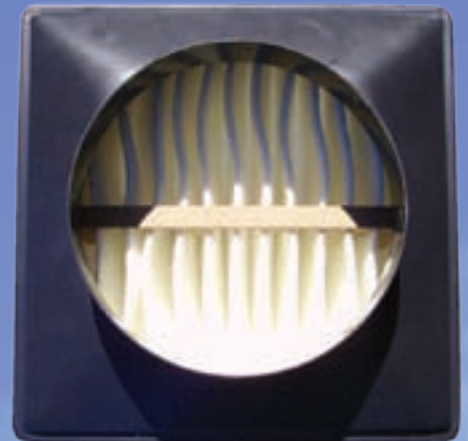

On the day, the ECOAIR install team will arrive, and within a couple of hours, will leave you with your new ventilation system, no mess (we always vacuum afterwards!), no structural alterations to your house, just some unobtrusive ceiling diffusers and a wall mounted thermostat and controller.

After a few simple instructions on how to operate your ECOAIR heat recovery system, you can relax and let the worry-free, whisper-quiet system start to work.

*...far less problems with colds last winter...
Mrs. Weller, Hamilton*

- (1) At the heart of the system is a very compact fan unit (shown left), which runs at less than 70 watts, which draws air from your roof space, then circulates that through your house, ventilating and heating or cooling as required.

- (2) The ECOAIR Synfilter collects 80% of all air particles down to a size of 0.2 microns.

- (3) The specially designed ceiling diffusers output the filtered air which is deflected out and across the ceiling, to ensure adequate ventilation of the chosen area. These may be outlets in the hallway, lounge and bedrooms that may have condensation or mould problems (often south-facing).

- (4) The ideal position for the thermostat is about 20cm below the ceiling, to line it up with the air flow from the ceiling diffuser. The controller is at a convenient height for adjustment.
